

“I've even had our neighbours think we had seeded a drought resistant canola because the crop looked so much better in areas where the SoilStar DHX-600 was used. The disc harrow seemed to bring the moisture to the surface for better germination. The difference looks like approximately 30% better crop yield using the SoilStar, wish I would have used it on all of the crop!”

SOILSTAR DHX-600

“We ran the Schulte SoilStar on about 3000 acres in a dry spring on our farm near Yorkton, SK. It was used for spring residue management from the previous crops of wheat, canola and peas. With the same pass we created a really nice bed for seeding into. We were impressed with the perfect job this 60 foot machine could do, dialed in by raising and lowering the coultter discs independently of the heavy harrows. Where we worked the land we had 100% canola germination, and in areas where we didn't use the disc harrow, it was down to 80. The machine also makes weeds germinate quicker in dry conditions, instead of waiting on the rain, allowing you to spray sooner. We've tried other units over the years and are glad we found the Schulte DHX-600 it's the perfect fit for our operation”
